Vilokan ADF Solutions' Environmental and Quality Policy

Closed loop recycling is at the heart of everything we do. Vilokan ADF Solutions helps airports across the globe to process used de-icing fluid, purify the water, recycle the glycol and protect the natural environment. We close the recycling loop and create a profitable business by providing end-to-end technology and service solutions. We make it possible for used solvents and water to be recycled for re-use. This enables our customers to reduce their impact on the environment.

A circular economy promotes sustainable development and rational utilisation of natural resources. Our objectives are customer-oriented, long-term and profitable. Where gains are realised at every stage, but most especially for the benefit of our shared environment. We are continually looking for ways to increase efficiency in our own operations and for our customers.

We always strive to:

- exceed the requirements and expectations of the customer
- ensure that all employees feel responsible for how customers and the wider market perceive the quality of the work performed and of the interaction process
- minimise our impact on the environment by focusing on preventive measures and constant improvements
- reduce waste and emissions and prevent contamination
- minimise energy consumption and use the most environmentally-friendly energy option available
- comply with environmental legislation, regulations and other requirements
- continually improve and monitor all of our processes
- We offer our customers experience, expertise and commitment

For the environment, for the economy, for the future.

Lars Mörnborg
